What Clinicians Need to Know About Monkeypox in the United States and Other Countries

Clinician Outreach and Communication Activity (COCA) Call
Thursday, May 24, 2022
Continuing Education

- Continuing education is not offered for this webinar.
To Ask a Question

- Using the Zoom Webinar System
  - Click on the “Q&A” button
  - Type your question in the “Q&A” box
  - Submit your question

- If you are a patient, please refer your question to your healthcare provider.

- If you are a member of the media, please direct your questions to CDC Media Relations at 404-639-3286 or email media@cdc.gov
Today’s Presenters

Agam Rao, MD, FIDSA
CAPT, U.S. Public Health Service
Medical Officer, Poxvirus and Rabies Branch
National Center for Emerging and Zoonotic Infectious Diseases
Centers for Disease Control and Prevention

Laura Hinkle Bachmann, MD, MPH, FIDSA, FACP
Chief Medical Officer
Division of STD Prevention
National Center for HIV/AIDS, Viral Hepatitis, STD and TB Control
Centers for Disease Control and Prevention

Brett Petersen, MD, MPH
CAPT, U.S. Public Health Service
Deputy Chief, Poxvirus and Rabies Branch
National Center for Emerging and Zoonotic Infectious Diseases
Centers for Disease Control and Prevention
What Clinicians Need to Know About Monkeypox in the United States and Other Countries

CDC Clinician Outreach and Communication Activity (COCA) call
May 24, 2022

Agam Rao, MD
Laura Bachmann, MD, MPH
Brett Petersen, MD, MPH
Situational update

- Non-Endemic continents with cases: Europe, North America, and Australia
- Most (but not all) cases among men who identify as: gay, bisexual, or men who have sex with men

- CDC working with partners in U.S. states and several countries
- As of this morning
  - 8* confirmed orthopox (OPX) cases
  - Of these, 1 is confirmed monkeypox (case Massachusetts)

*This is the number as of this morning. This number is changing rapidly*
Confirmed orthopox (OPX) vs. confirmed monkeypox

- 2-step process for testing specimens
  - 1\textsuperscript{st}: State labs that are part of the Laboratory Response Network\(^*\) can perform OPX generic test; this confirms presence of OPX DNA from rash lesions $\rightarrow$ \textbf{Positive = confirmed orthopox case}
  - 2\textsuperscript{nd}: Confirmatory testing by real time PCR (only available at CDC) $\rightarrow$ \textbf{Positive = Confirmed monkeypox case}

- For this event, we are treating all confirmed orthopox cases as if they are monkeypox until proven otherwise
Signs and symptoms

- Historically: characteristic rash preceded by prodromal symptoms (e.g., fever, lymphadenopathy, flu-like symptoms)

- Current cases: atypical features
  - Rash still characteristic; but often starting in genital and perianal areas
  - Rash sometimes not disseminating to other parts of body
  - Being recognized at outpatient clinics because easily confused with sexually transmitted infections
  - Prodromal symptoms mild or not occurring

- Reasons for unusual presentation unknown at this time

- Patient infectious once symptoms begin (whether prodromal or rash symptoms) until lesions scab and scabs fall off
Incidence

- Monkeypox is endemic in several African countries
- From 2018 to May 2022, 9 imported cases of monkeypox to non-endemic countries
  - United States (2)
  - United Kingdom (5)
  - Israel (1)
  - Singapore (1)
- No flight contacts developed infection
- One healthcare worker developed monkeypox (UK) and 2 family members acquired monkeypox (UK)
Transmission

- Direct or indirect contact with body fluids or lesion materials
- Contact with fomites
- Exposure to respiratory secretions
- **Examples of high and intermediate risk exposures**
  - Shared towels and bedding (infectious body fluids and scabs may be present)
  - Skin-to-skin contact with a patient who has monkeypox
  - Being inside the patient's room or within 6 feet of a patient during any procedures that may create aerosols from oral secretions, skin lesions, or resuspension of dried exudates, without wearing an N95 or equivalent respirator (or higher) and eye protection
- **Good news: Not easily transmitted**
What clinicians need to know: Diagnosis

- CDC issued health advisory on 5/20
- Advice for clinicians
  - Be vigilant to possibility of monkeypox if characteristic rash present*
  - Know that illness is presenting atypically
  - Clinicians working in outpatient clinics may be first to suspect monkeypox
    - Many patients have mild symptoms
    - Easy to confuse with sexually transmitted infection OR varicella zoster virus
  - Obtain sexual and travel history; determine if any contacts have/had a similar rash
- Obtain specimens †
- Notify health department
  - Consider initiating contact tracing and monitoring §
  - Facilitate laboratory testing

*https://www.cdc.gov/poxvirus/monkeypox/clinicians/clinical-recognition.html
†https://www.cdc.gov/poxvirus/monkeypox/clinicians/monitoring.html
§https://www.cdc.gov/poxvirus/monkeypox/clinicians/monitoring.html
What clinicians need to know: Treatment and prevention

▪ **Patients**
  - All specimens reported outside of endemic countries, to date, West African clade of monkeypox (associated with milder illness)
  - Supportive care typically enough
  - Antivirals are available through consultation with CDC

▪ **Contacts**
  - Monitoring of healthcare personnel should be reported to health department; monitoring is for 21 days
  - Post-exposure prophylaxis with 2 U.S. licensed vaccines a possibility depending on risk level*
  - Pre-exposure prophylaxis for certain healthcare personnel available †

---

* [https://www.cdc.gov/poxvirus/monkeypox/clinicians/prep-collection-specimens.html](https://www.cdc.gov/poxvirus/monkeypox/clinicians/prep-collection-specimens.html)
† [https://www.cdc.gov/poxvirus/monkeypox/outbreak/current.html](https://www.cdc.gov/poxvirus/monkeypox/outbreak/current.html)
What clinicians need to know: Miscellaneous*

- Infection control: hospital and home
- Duration of isolation
- Decontamination of contaminated surfaces
- Monkeypox virus does not have the potential to be a pandemic; number of cases worldwide still low
- Cases may be occurring in communities other than those where the initial cases have been identified

* https://www.cdc.gov/poxvirus/monkeypox/clinicians/index.html
2.4 million cases of chlamydia, gonorrhea, and syphilis were reported in the first year of the COVID-19 pandemic.
Monkeypox cases – 2022

- Some reported cases in men who report sexual contact with other men

- Atypical presentation?
  - Genital and/or perianal lesions
  - Proctitis
  - Much to be learned...

- Individuals may present to sexual health clinics for care

- Monkeypox is not a sexually transmitted infection in the typical sense, but it can be transmitted during sexual and intimate contact, as well as with personal contact and shared bedding/clothing.
Genital Ulcer Disease: Differential Diagnosis

**Infectious**
- Herpes simplex virus
- Syphilis
- Chancroid
- Lymphogranuloma venereum (LGV)
- Granuloma Inguinale

**Non-infectious**
- Recurrent aphthous stomatitis
- Behcet’s Disease
- Trauma
- Squamous cell carcinoma
- Drug-induced
- Other
Other infections to consider

**Diffuse Rash**
- Syphilis
- Varicella/VZV
- Disseminated herpes
- Molluscum contagiosum
- Other pox viruses
- Disseminated fungal infections
- Disseminated gonococcal infection

**Proctitis**
- Gonorrhea
- Chlamydia (including LGV)
- HSV
Distinguishing monkeypox from other rash illnesses

- **Comprehensive history**
  - **History of present illness** – typical sequence of clinical manifestations
    - Usually fever, malaise, headache, sore throat, cough, lymphadenopathy
    - Macules → papules → vesicles → pustules → scabs
    - Tongue/mouth → face → arms/legs → hands/feet (including palms/soles)
    - Pain and pruritis may be prominent
    - Clinical presentation in current outbreak may not be typical!
Distinguishing monkeypox from other rash illnesses

- **Social history**
  - Travel history – particularly to central and west African countries and other countries where non-endemic monkeypox has been reported
  - Contact with a person or people with confirmed or suspected monkeypox
  - Man who regularly has close or intimate in-person contact with other men, including those met through online website, digital application (“app”), or at a bar or party
Physical examination

- Perform thorough exam of all skin in room with good lighting
  - Clues may be present in other areas of the body for persons presenting with genital/perianal complaints

- Rash concentrates on face, arms, legs (centrifugal distribution)

- Lesions typically similar size and at same stage

- Lesions become umbilicated
Primary syphilis
Primary and secondary syphilis – overlap

- Primary chancre
- Secondary papulosquamous lesion
Secondary syphilis
Secondary syphilis*

Monkeypox

Molluscum contagiosum
Disseminated cryptococcal infection
Disseminated gonococcal infection
Diagnostic considerations for STIs

- **Genital ulcer disease diagnostic evaluation**
  - Syphilis serology tests
  - Darkfield examination from lesion exudate or tissue (or nucleic acid amplification test (NAAT) if available)
  - NAAT* or culture for genital herpes type 1 and 2
  - Serologic testing for type-specific HSV antibody
  - NAAT or culture for *Haemophilus ducreyi* in settings where chancroid prevalent

- **For unexplained rash, consider syphilis serology tests**

*Preferred

STI Treatment Guidelines

2021 RECOMMENDATIONS NOW AVAILABLE

STI Treatment Guidelines Update
CDC's Sexually Transmitted Infections (STI) Treatment Guidelines, 2021 provides current evidence-based prevention, diagnostic and treatment recommendations that replace the 2015 guidance. The recommendations are intended to be a source for clinical guidance. Healthcare providers should always assess patients based on their clinical circumstances and local burden.

View the full STI Treatment Guidelines.

Access print-friendly versions of the wall chart, pocket guide, and guidelines.

Explore STD trainings, technical assistance, clinical consultation services, and more.

Medical Countermeasures Available for Prevention and Treatment of Monkeypox

Brett Petersen, MD, MPH

Captain, U.S. Public Health Service
Deputy Chief, Poxvirus and Rabies Branch
Centers for Disease Control and Prevention

Clinician Outreach and Communication Activity (COCA) Call
May 24, 2022
Medical Countermeasures Stockpiled for Orthopoxviruses

- **Vaccines**
  - JYNNEOS
  - ACAM2000

- **Treatment**
  - Tecovirimat
  - Vaccinia Immune Globulin Intravenous (VIGIV)
JYNNEOS

- JYNNEOS is a live vaccine produced from the strain Modified Vaccinia Ankara-Bavarian Nordic (MVA-BN), an attenuated, non-replicating orthopoxvirus
  - Also known as IMVAMUNE, IMVANEX, MVA

- Licensed by FDA in September 2019

- Indication
  - JYNNEOS is indicated for prevention of smallpox and monkeypox disease in adults 18 years of age and older determined to be at high risk for smallpox or monkeypox infection

https://www.fda.gov/vaccines-blood-biologics/jynneos
ACAM2000

- ACAM2000 is a live vaccinia virus vaccine
- Licensed by FDA in August 2007
- Replaced Dryvax - license withdrawn by manufacturer and remaining vaccine destroyed

Indication
- ACAM2000 is indicated for active immunization against smallpox disease for persons determined to be at high risk for smallpox infection
- CDC-held Emergency Access Investigational New Drug Protocol allows use for Non-Variola Orthopoxvirus Infection (e.g., monkeypox) during an outbreak

https://www.cdc.gov/mmwr/preview/mmwrhtml/mm5708a6.htm

*Both ACAM2000 and Dryvax are derived from the NYC Board of Health strain of vaccinia; ACAM2000 is a “second generation” smallpox vaccine derived from a clone of Dryvax, purified, and produced using modern cell culture technology.*
On November 3, 2021, the Advisory Committee and Immunization Practices (ACIP) voted to recommend vaccination for select persons at risk for occupational exposure to orthopoxviruses:

- Research laboratory personnel, clinical laboratory personnel performing diagnostic testing for orthopoxviruses, and for designated response team members at risk for occupational exposure to orthopoxviruses.

- Healthcare personnel who administer ACAM2000 or care for patients infected with replication competent orthopoxviruses based on shared clinical decision-making.

Pre-Exposure Prophylaxis

Transmission of monkeypox requires prolonged close interaction with a symptomatic individual.

Brief interactions and those conducted using appropriate PPE in accordance with Standard Precautions are not high risk and generally do not warrant PEP.

|                    | Monitoring | PEP | entered the patient room without wearing eye protection on one or more occasions, regardless of duration of exposure - OR -
|                   |            |    | During all entries in the patient care area or room (except for during any procedures listed above in the high-risk category), wore gown, gloves, eye protection, and at minimum, a surgical mask - OR -
|                   |            |    | Being within 6 feet of an unmasked patient for less than 3 hours without wearing at minimum, a surgical mask - OR -
|                   |            |    | Exposure that, at the discretion of public health authorities, was recategorized to this risk level based on unique circumstances (e.g., uncertainty about whether Monkeypox virus was present on a surface and/or whether a person touched that surface)
| No Risk            | None       | None | Exposure that public health authorities deemed did not meet criteria for other risk categories

https://www.cdc.gov/poxvirus/monkeypox/clinicians/monitoring.html#exposure
Tecovirimat

- Tecovirimat is an antiviral medication that is approved by the FDA for the treatment of human smallpox disease in adults and pediatric patients weighing at least 3 kg
  - Also known as TPOXX or ST-246
- Oral capsule and IV formulations approved by FDA in July 2018 and May 2022, respectively
- Indication
  - Tecovirimat is indicated for the treatment of human smallpox disease in adults and pediatric patients weighing at least 3 kg
  - CDC-held Emergency Access Investigational New Drug Protocol allows use of Tecovirimat for Non-Variola Orthopoxvirus Infection (e.g., monkeypox)
    - Includes allowance for opening an oral capsule and mixing its content with liquid or soft food for pediatric patients weighing less than 13 kg
- Available from the Strategic National Stockpile as an oral capsule formulation or an intravenous vial

https://www.accessdata.fda.gov/drugsatfda_docs/label/2018/208627s000lbl.pdf
Guidance for Treatment of Monkeypox

- Many individuals infected with monkeypox virus have a mild, self-limiting disease course in the absence of specific therapy

- The prognosis for monkeypox depends on multiple factors such as previous vaccination status, initial health status, and concurrent illnesses or comorbidities
Guidance for Treatment of Monkeypox

- Persons who should be considered for treatment following consultation with CDC might include:
  - Persons with severe disease (e.g., hemorrhagic disease, confluent lesions, sepsis, encephalitis, or other conditions requiring hospitalization)
  - Persons who may be at high risk of severe disease:
    - Persons with immunocompromise
    - Pediatric populations, particularly patients younger than 8 years of age
    - Pregnant or breastfeeding women
    - Persons with one or more complications (e.g., secondary bacterial skin infection; gastroenteritis with severe nausea/vomiting, diarrhea, or dehydration; bronchopneumonia; concurrent disease or other comorbidities)

- Persons with monkeypox virus aberrant infections that include its accidental implantation in eyes, mouth, or other anatomical areas where monkeypox virus infection might constitute a special hazard (e.g., the genitals or anus)
Vaccinia Immune Globulin Intravenous (VIGIV)

- VIGIV is licensed by FDA for the treatment of complications due to vaccinia vaccination, including:
  - Eczema vaccinatum
  - Progressive vaccinia
  - Severe generalized vaccinia
  - Vaccinia infections in individuals who have skin conditions
  - Aberrant infections induced by vaccinia virus (except in cases of isolated keratitis)

- CDC-held Emergency Access Investigational New Drug Protocol allows use of VIGIV for Non-Variola Orthopoxvirus Infection (e.g., monkeypox)

https://www.fda.gov/vaccines-blood-biologics/approved-blood-products/vaccinia-immune-globulin-intravenous-human
Medical Countermeasure Requests

- Medical Countermeasures for Monkeypox can be requested from the CDC Emergency Operations Center (770-488-7100)

- Requests for vaccines for PEP, Tecovirimat, or VIGIV should come from State or Territorial Health Authorities
  - These products will be supplied by the Strategic National Stockpile

- Vaccine for PrEP will be supplied by CDC Drug Service

- CDC is available for consultations to assist with medical countermeasure utilization including appropriate vaccine and antiviral use
